

10/10/2024

Dear Fans of Musser Communications,

Thank you for visiting, and remember, please, please, please don't tell anyone what we're doing here!

Because to be honest, writing is therapy for me (as I don't seem to be any good at making money at it) so technically, that makes this site a personal vanity site, so Chris, and everybody else who comes in contact with us at Musser Communications, can hopefully heal, excuse me, **heal** someday.

Therefore, please don't get hung up on whether the content constantly changes (or not), and consider mussercommunications.com **ephemeral**:

e·phem·er·al

/ə'fem(ə)rəl/

adjective

adjective: **ephemeral**

1. lasting for a very short time.
"fashions are ephemeral," just like my thoughts and ideas and conclusions--I can't stop them from changing over time so I guess I'll change a little with them, too.
2. #2 has nothing to do with "Ephemeral," or anything else we've been talking about, etc. but we'll phrase it as a question—Chris, why don't you configure a secure protocol (i. e. HTTPS) for people to use to access MusserCommunications.com at Sonic.net?
3. Answer: First of all, I hope you indulge me just a little, first, because every time I try to add to my thoughts about MusserCommunications.com security profile, LibreOffice Writer ADDS ANOTHER NUMBER!
4. But to answer #2, SONIC.NET doesn't offer HTTPS (and they're trying to get out of the hosting business, but they can pry mine out of MY COLD DEAD hands, if there's one box left.)
5. Hell, I didn't change my Sonic login password for 19 years with no hiccups, they're that good.
6. So, no, there shouldn't be any hacking exposures to Musser Communications, as we keep everything clean on our end, and we're confident in their care, too--

Ephemerally Yours,

Chris, *and the rest of the Musser Communications Development Team*
